

VMS + CCTV AND SPEED RADAR

CCTV & SPEED RADAR ON VMS BOARDS

Integrated CCTV and radar technology transforms your VMS into a powerful, all-in-one roadside intelligence unit with no additional infrastructure required.

- Real-time radar detection captures critical traffic data including average speed, maximum speed, vehicle count, and vehicle classification, giving you a complete picture of traffic behaviour at any location.
- High-definition CCTV provides continuous visual monitoring of the road environment, supporting evidence capture, and remote site management.
- Remotely accessible via 4G/LTE, allowing your team to view live footage, adjust messaging, and pull traffic reports.
- Traffic data is displayed in the RPM Track platform and presented in clear, visual graphs for easy interpretation with the ability to export reports whenever needed, supporting client deliverables, compliance, and post-project analysis.
